A: There is a tab under bluetooth settings > adapters > Bluetooth adapters. Ontogeny of the expression of GABAergic markers by the cerebellum and the hindbrain of the rat. Rats are born with an immature cerebellum that undergoes considerable reorganization throughout the first three postnatal weeks. The developmental profile of GABAergic markers in the cerebellum and hindbrain of rat pups from postnatal day (P) 1 to P10 has been examined immunocytochemically. Antibodies specific to glutamic acid decarboxylase (GAD), glutamate decarboxylase (GAD67), and the gamma-aminobutyric acid (GABA)-synthesizing enzyme, glutamic acid decarboxylase 65 (GAD65), were used to define the distribution of cerebellar GABAergic neurons at different stages of development. Marked changes in the expression of these enzymes were observed during the first week following birth. At P1-2, most cerebellar neurons expressed GAD, while GAD67 and GAD65 were expressed by cells in both the lateral and the medial lobules. At P4, GAD67 and GAD65 continued to be expressed by granule cells of the lateral and medial lobules, while GAD was restricted to the molecular layer. GAD67 expression was also seen in Purkinje cells from P4. However, the majority of cerebellar neurons that expressed GAD65 and GAD67 during this developmental period also contained GABA immunoreactivity. The mitral and trabecular cells of the rhombencephalon expressed GAD67 and GAD65 during the first two postnatal f678ea9f9e
